This report has been reviewed by the Monitoring and Data Analysis Division, Office of Air Quality Planning and Standards, Office of Air and Water Programs, Environmental Protection Agency, and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation for use. Copies are available free of charge to Federal employees, current contractors and grantees, and nonprofit organizations - as supplies permit - from the Air Pollution Technical Information Center, Environmental Protection Agency, Research Triangle Park, North Carolina 27711, or copies may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20460.

Publication No. EPA-450/1-73-001b

FOREWORD

During final preparation of this report, several events occurred that affected its contents. Uncertainties have arisen concerning which reference method for nitrogen dioxide will be designated as the standard method (three candidate methods are proposed). Consequently, air quality data for nitrogen dioxide were deleted from this report, but are available in the Federal Register (38 FR 15174) of June 8, 1973.

In addition, notice was given in the Federal Register (38 FR 11355) of May 7, 1973 of a proposed revocation of the annual secondary air quality standard for sulfur dioxide. References to this standard were retained in this report because the proposed revocation should not affect the results or conclusions presented here.

Finally, notice of a proposed reclassification of Air Quality Control Regions for oxides of nitrogen was given by EPA's Acting Administrator in the Federal Register (38 FR 15174) of June 8, 1973. The Air Quality Control Region Priority Classifications for oxides of nitrogen that are contained in this report do not reflect any proposed changes.

ABSTRACT

This report represents the first major attempt in the history of the Federal air program to evaluate trends in air quality and emissions on both a national and a regional basis.

Based on data from the National Air Sampling Networks, air quality trends are presented for (1) total suspended particulates for 1960 through 1971, (2) carbon monoxide, oxides of nitrogen, and oxidants for 1962 through 1971, and (3) sulfur dioxide for 1964 through 1971. Included is a detailed evaluation of ambient air quality for three Air Quality Control Regions. For the period 1940 through 1970, emissions trends are presented on a national basis only.

Air quality data, emissions data, and summaries of monitoring activities are presented for each State and Air Quality Control Region. Specific program areas emphasized are data acquisition and analysis, and trend identification and interpretation.

Key Words

Air Quality Data	Emissions Data	Oxidants
Air Quality Standards	Emissions Trends	Oxides of Nitrogen
Air Quality Trends	Hydrocarbons	Particulate Matter
Carbon Monoxide	Monitoring	Sulfur Dioxide
Data Analysis	Nitrogen Dioxide	

ACKNOWLEDGMENT

The Office of Air and Water Programs of the Environmental Protection Agency would like to thank the many local and State agencies that have contributed air quality and emissions data.

APPENDIX G.
SUMMARY OF DATA FROM AIR QUALITY MONITORING STATIONS BY AQCR, 1969-1971

These listings of selected statistics from individual stations within each AQCR, for each pollutant method, complement the national and regional tables presented in the main report. These tables summarize the numbers of stations exceeding various standards. Tables in this appendix include quantitative information on the measurements acquired at each station and should be useful in assessing the degree to which a standard has been met.

Data collected by different instrument methods are listed separately because the degree of comparability has not been strictly defined. Reference methods are identified.

Data collected by different agencies are identified by the last three characters (the agency/project code) in the station identification code. The letter A identifies a station as Federally supported (although many have been operated by local personnel). An F identifies a State agency station, G a county agency, H a city agency, I a district agency, etc. (see APTD-0633, SAROAD Users Manual). The code 01 identifies an urban or population-oriented station, 02 identifies a source-oriented station, 03 identifies a nonurban or rural background station, 10 identifies a CAMP station.

Only stations that have at least one quarter's valid data on record in the data bank appear in these tables. Annual summary statistics are displayed only for those stations that have records including four valid quarters.

For 24-hour integrating samplers (e.g., hi-vols, bubblers), a valid quarter's record consists of at least five sample measurements representatively distributed among the months of that quarter. Distributions of measurements that show no samples in 2 months of a quarter, or that show no samples in 1 month and only 1 sample in another month are judged unacceptable for calculating representative estimates of means and ranges. For continuous instruments, at least 75 percent of the possible hourly values must be present in a quarter to calculate valid summaries.

Since all four quarters must be valid to support representative or valid annual summary statistics, there must be a minimum of 20 measurements derived from a 24-hour integrating method. Because such samples are nearly always collected on a carefully defined schedule, meteorological and day-of-the-week biases tend to average out over a year's time.

Validity requirements are imposed to provide a basic statistical reliability to assessments of data with respect to NAAQS. Where annual summary statistics are included with a stations's summary, the data can be considered representative for comparison with both annual and short-term standards. If the data are too fragmentary to support annual statistics, but at least one quarter's record is valid, these data are summarized where short-term standards apply. If a station with an incomplete annual record reports values exceeding a short-term standard, that information is

useful. If such a partial data record includes no values exceeding a short-term standard, the result must be considered inconclusive.

In addition to a representative amount of data from an individual station, a minimum number of stations is needed to provide a representative picture of the spatial variation in diverse sectors of an Air Quality Control Region. A table recommending a minimum number of stations for each AQCR is presented in this report. Even if all station measurements in an AQCR meet the standards for a pollutant, the resulting data must be considered inconclusive if the number of valid stations is less than that recommended for representative coverage.

Because of coding errors, the oxidant summaries for CAMP stations (agency/project code A10) appearing in Table G-7 should be compared with oxidant summaries appearing in Table G-8.

There may be discrepancies between data presented in this appendix and those appearing in the summary of the report. This is due in part to the time sequence of data processing and computer program execution and to the continual updating of the NADB data files.

G.1 SUSPENDED PARTICULATE MATTER

At present, there is only one generally accepted method for the measurement of suspended particulate matter, i.e., gravimetric analysis of the net weight of material collected on a 20- by 25-centimeter (8- by 10-inch) fiberglass filter through which approximately 2200 cubic meters of air have been drawn over a 24-hour period by a high volume sampler.

The hi-vol stations in this table are listed in the first column by Air Quality Control Region. If a region encompasses parts of more than one state, the stations are sorted according to State areas within that region. On the same line as each region's number and name is the current Priority Classification for the particular pollutant.

Each line in the body of the table includes the station code and name as well as the year being summarized and the number of valid values reported.

The next two columns show the number, if any, of daily values exceeding the 24-hour standards, both secondary (150 $\mu g/m^3$) and primary (260 $\mu g/m^3$). To provide a quantitative measure of the upper end of the sample distribution, the first and second highest 24-hour values are listed in the next two columns. From these values, one can understand either the degree to which a 24-hour standard has been exceeded or the margin by which it has been met.

The final three columns pertain to the annual geometric mean, showing its ratio to the secondary (60 $\mu g/m^3$) and primary (75 $\mu g/m^3$) annual standards in addition to the annual geometric mean itself.

Stations appearing in this listing, but showing no entries in the three annual summary columns, have valid data for at least one quarter on record, but do not meet the yearly validity criterion.

G.2 SULFUR DIOXIDE

The stations reporting 24-hour bubbler data for sulfur dioxide are listed by Air Quality Control Region in Table G-2. After each AQCR code and name is the AQCR Priority Classification. Each line under the AQCR name contains a station code and station name, followed by the year being summarized and the number of valid values reported. The next two columns show the number of values that exceeded the secondary (260 $\mu g/m^3$) or primary (365 $\mu g/m^3$) 24-hour standards. The next two columns list the first and second highest 24-hour values in order to provide a quantitative measure of the upper end of the distribution of measurements. The final three columns pertain to the annual mean, showing the ratios of the mean to the secondary (60 $\mu g/m^3$) and to the primary (80 $\mu g/m^3$) annual standards, in addition to the value of the annual arithmetic mean for that station.

Stations appearing in Table G-2, but showing no entries in the three annual summary columns, have valid data for at least one quarter but do not meet the annual validity criterion.

The format in Tables G-3, G-4, and G-5 is identical. Following each AQCR code and name is the AQCR Priority Classification and the list of stations in the AQCR, by State if it is an interstate region. Beside each station name is the year being summarized and the number of valid hourly values reported. The next two columns display the number of 24-hour average values that exceeded the secondary (260 $\mu g/m^3$) and primary (365 $\mu g/m^3$) 24-hour standards. The next two columns were meant to contain the two highest 24-hour average values (midnight to midnight); however, the existing retrieval format supplies only the highest value. The next column provides the number of 3-hour averages that exceeded the 3-hour standard (1300 $\mu g/m^3$).

The final three columns pertain to the annual mean, first presenting the ratios of the mean to both the secondary (60 $\mu g/m^3$) and primary (80 $\mu g/m^3$) annual standards, in addition to the value of the annual arithmetic mean for that station.

Stations appearing in these three tables, but showing no entries in the three annual summary columns, have valid data for at least one quarter but do not meet the annual validity criterion.

G.3 CARBON MONOXIDE

Table G-6 summarizes hourly data for carbon monoxide measured by the non-dispersive infrared (NDIR) method. Following each station code and name is the year for which the data are reported, the number of valid hourly values reported, and the number of values exceeding the 1-hour and 8-hour standards. (Note: the 8-hour standard is applied to running 8-hour averages; i.e., after calculating the average for the first 8 hours, the first hour is dropped and the ninth hour is added, etc.)

The next two columns list concentrations, in milligrams, per cubic meter and the 99th percentile of 1-hour values, which gives some perspective to the distribution of values in the upper range. The first and second highest 1-hour values and the highest 8-hour define the upper extreme of the distribution. (The second highest 8-hour value will be included in future reports.) The final column contains the annual arithmetic mean if valid data have been reported for 75 percent of the hours in the year.

G.4 OXIDANTS

Measurements of total oxidants are reported separately in Tables G-7, G-8, and G-9 for each instrument method because the comparability of the results has not been strictly defined. The format of the three tables is identical.

Each AQCR listing begins with the AQCR code, name, and priority classification. Subsequent lines contain a station code and name. The next two columns show the year being summarized and the number of valid 1-hour values reported. The next column contains the number of 1-hour values exceeding the standard (160 ug/m^3), and the next two columns list the first and second highest 1-hour values. The final column lists the 99th percentile of 1-hour values, which gives some perspective to the distribution of values in the upper range.

APPENDIX H.

AQCR EMISSIONS SUMMARIES

The tables presented in Appendix H summarize the detailed emission inventory data submitted by the States in their State Implementation Plans. A separate entry is shown for each of the five air pollutants emitted (PM, SO_2, CO, HC, and NO_x) with breakdowns for the five most important source categories.

These emission estimates are those used by the States in calculating control strategies. They are for the most part representative of 1970, although some data are reported for 1966, 1968, and 1969.

It should be noted that three different summaries are presented. Table H-1 shows the emission totals for each entire State; Table H-2 is a summary of emissions from the AQCR portions within States; and Table H-3 shows emissions for the entire AQCR for interstate AQCR's only. All three summaries, in addition, contain the emission densities by pollutant in both tons/square kilometer and tons/person.

The data in each table are listed by the five most important source categories namely, fuel combustion in stationary sources, transportation, solid waste disposal, industrial processes, and miscellaneous. Stationary fuel combustion sources include both area sources and point sources of fuel used for heat and power, such as residences, industries, institutions, and commercial buildings. The transportation category includes automobiles, trucks, buses, aircraft, trains, and vessels. Solid waste disposal emissions include those from all sources of open burning and incineration, while emissions from industrial processes include only those industrial air pollutants emitted during the manufacturing process. Miscellaneous emissions types vary according to the Region involved, but most commonly include solvent evaporation, agricultural burning, forest fires, structural fires, and burning in coal-refuse banks.
